🎓 Gradient Boosting vs Random Forest: The Complete Guide

RF 86.7% beats XGBoost 86.4% - Why & When This Happens!

Author: Adwaith Reddy Lethakula | **Course:** ML Tutorial Assignment | **Date:** March 2026
GitHub Repository: github.com/adwaithreddy12/gradient-boosting-tutorial

---

🚨 Key Discovery

Insight	Explanation
Random Forest WINS	86.7% beats XGBoost 86.4% on balanced data
Why?	RF uses **parallel trees**. XGBoost uses **sequential trees**
Takeaway	Always test RF baseline first!

In [ ]:
```
# INSTALL REQUIRED PACKAGES (Run this FIRST!)
!pip install xgboost plotly pandas scikit-learn seaborn openpyxl

# Verify installation
import sys
!{sys.executable} -m pip install xgboost --quiet
print("✅ XGBoost installed successfully!")

# Restart kernel after this cell (Kernel -> Restart) then run imports again
```

🤔 Hyperparameters: The "Knobs" You Control

Beginner Analogy: Cooking Recipe

Hyperparameter	Cooking Equivalent	Effect
Learning Rate	Spice per bite	Too high = burns mouth. Too low = bland
N_Estimators	Recipe steps	More steps = better (but diminishing returns)
Max Depth	Chop size	Deeper = complex patterns (risks overfit)

Deep Technical:

Learning Rate (η) shrinks each tree's contribution:

`Final Prediction = η × Tree1 + η × Tree2 + ... + η × TreeN`

Too high η → Overfits quickly
Too low η → Needs 1000s trees, slow training

2        False           2
```

1. Dataset & Random Forest Baseline

5000 synthetic samples mimicking Spaceship Titanic Kaggle data:

- 13 features (Age, CryoSleep, spending categories)
- Perfect 50.1% class balance
- **RF Baseline: 86.7% CV accuracy** (excellent!)

Top features: CryoSleep (15.7%), ShoppingMall (12.5%)

In [19]:
```
def preprocess_data(df):
    df_clean = df.copy()

    # Encode categorical
    cat_cols = ['Cabin_Deck']
    le = LabelEncoder()

   CryoSleep      0.1573

✅ CLEAN PLOT 1 + TABLE SAVED!
```

🏆 Why Random Forest Won (Technical Deep Dive)

Result: RF 86.7% > XGB 86.4% (-0.3%)

Fundamental Difference:

Why RF wins here:

1. **Perfectly balanced data** (50.1%) → No sequential correction needed
2. **Simple patterns** → RF averaging works perfectly [web:110]
3. **No missing values** → RF doesn't need XGB's advantages

In [21]:
```
# Cell 5a: INSTALL XGBOOST (Run BEFORE Cell 5)
!pip install xgboost --no-cache-dir
import xgboost as xgb
print("✅ XGBoost installed:", xgb.__version__)
```

```
Requirement already satisfied: xgboost in c:\users\pagad\anaconda3\lib\site-packa

3. Key Insights & When to Use Each

🏆 Random Forest Wins When:

- Balanced tabular data (like this case)
- Need interpretability (feature importance)
- Baseline model

⚡ XGBoost Wins When:

- Imbalanced classes
- Missing values
- Very large datasets

Optimal XGB settings: LR=0.05, 50-200 trees
